

JIOMART PRODUCT DATA ANALYSIS

Overview

This project focuses on analyzing JioMart product data using Microsoft Excel. The dataset contains product-level information such as pricing, discounts, ratings, and other e-commerce related attributes. Excel was used for data cleaning, transformation, and preparation for structured analysis.

Dataset Information

- Source: JioMartProduct Dataset (CSV format)
- Raw Dataset: 1026 rows and 7 columns
- Cleaned Dataset: 1026 rows and 11 columns
- Key fields include product name, category, price, discount, rating, and related attributes

Data Cleaning Process (Microsoft Excel)

- Removed unnecessary symbols and formatting inconsistencies
- Standardized column names for clarity
- Used Excel functions to clean price and discount columns
- Converted text-based numeric fields into proper number formats
- Handled missing and inconsistent values
- Created structured cleaned dataset for analysis

Analysis & Insights

The cleaned dataset enables meaningful analysis such as price comparison, discount pattern evaluation, rating-based product performance, and identification of high-value products. The structured data supports further visualization and reporting workflows.

Tools Used

- Microsoft Excel (Data Cleaning & Transformation)
- CSV Data Handling
- Basic Data Analysis & Formatting Techniques

Conclusion

This project demonstrates practical data cleaning and analytical skills using Microsoft Excel. It highlights the ability to transform raw e-commerce product data into a structured format suitable for business analysis and reporting, making it a strong portfolio project for entry-level data analytics roles.
